

QLIGHT PRODUCTS

QLIGHT PRODUCTS

You can select the most suitable product according to the function and installation site and -purpose of the apparatus. QLight products are used for a variety of purposes, for example conveying emergency information, alerting- and warning systems, unusual information recognition, validation information guidance, information announcement and more.

In the early 1990s, there was great development and remarkable growth in the field of plant equipment as well as the automation industry in Korea. This can be ascribed to a variety of technical innovations and advancements in most industries in the Korean sphere. However, visual signal device essential for factory automation and equipment robotization, remained undeveloped and made use of the older limited types of apparatus with simple functions. Therefore, a strong demand for the development of advanced, multi-functional products made to high quality standards arose in the market. QLight took the initiative and was the first company in the field to develop explosion proof type products in Korea. We are also the first Korean company that developed the generalized LED warning light and signal tower.
